

# EdgeData & Forensics

- Sometimes you don't know what you are looking for until you find it. Or you don't have enough information to fill in the information gaps. Data forensics is about setting up workflows to identify those data sources that capture forensic information, or compute forensic information or consume forensic information. Use forensics to avoid, or minimize, disruptions to your business.
  - Who? EdgeData employees work with your business to identify the incident, event, restoration and recovery workflows for your business.
  - What? EdgeData develops the work flows that safeguard your capture, compute and consume processes within the business and provides for business continuity, disaster recovery and information needed to analyze the impact to your business to reduce reputation, performance, compliance or insurance risk.
  - When? EdgeData developed workflows establish the forensic architecture ahead of the crisis or challenge, so the business is ready for any storm (natural or man-made).
  - Why? EdgeData experiences have helped businesses transform their risk profile and survive /thrive when challenged with natural or man-made threats. Put simply, what can happen will happen, so be prepared.
  - How? EdgeData defines the "money pumps" of your business and safeguards the processes that support them.
